Stereo Impact Telescoping Boom

SANTA BARBARA • SANTA CRUZ

Boom Assembly:

Partial deployment of inner tube. Outer tube, guide track removed. Rollers ride on tube surfaces.

Restoring moment given by springs. Worst case: pins at sockets, not engaged. Restoring moment, at any pin / socket location, is 0.04 kg-m, for current spring design. For a zero extension situation, ie. release operates, Stacer does not deploy, the restoring moment is 4.95 kg-m.

Rollers travel on inside of 80mm tube (not shown)

Stereo Impact Telescoping Boom

Boom Assembly:

Stowed position, top view. Rollers rest on tube surfaces. Innermost 2 tubes shown. Pattern repeats for all 5 tubes. Pins are blue, rollers magenta, Gr/E tubes are thin white rings between green and orange rings. Pins travel 8mm to mate with sockets, both with an included cone angle of 10° to provide a self-locking interface. The offset of 3 of the sockets takes up play of pins in guides, providing a kinematic (although over-constrained) mounting.

Background information for stowed design: For launch, tubes are retained by SMA pinpuller through Stacer tip piece, which in turn is connected to the innernost tube. Kick springs in base of boom initiate deployment when SMA triggered, Stacer provides extension force. When end of travel is reached, pins lock into sockets to give rigid boom.

Stereo Impact Telescoping Boom

Ring / Pin Subassemblies:

Upper inner and outer rings, lower inner and outer rings. Rollers to be retained into pins by spring pins (SSt 300). Pins to be retained and guided by slotted grooves with pins in housing. Also used for pin retraction for stowing (not shown). Spring force supplied by coil compression springs (material TBD: BeCu or SSt300).

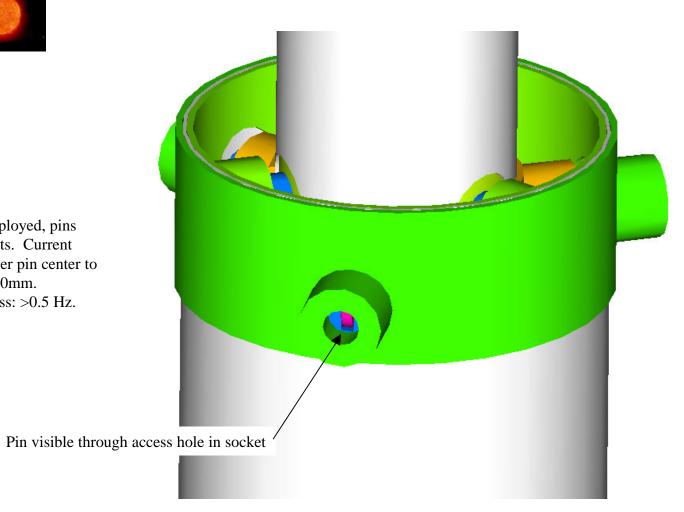

BERKELEY · DAVIS · IRVINE · LOS ANGELES · RIVERSIDE · SAN DIEGO · SAN FRANCISCO

Stereo Impact Telescoping Boom

Boom Assembly: Inner tube fully deployed, pins inserted into sockets. Current offset value of lower pin center to upper pin center: 10mm. Anticipated stiffness: >0.5 Hz.

Stereo Impact Telescoping Boom

Remaining Items:

- Harness design: Current coax sample is OK, finalize (for now) number of STP and singles, build up a 1m section for mechanical testing.
- Estimated frequency of boom in unlatched conditions:
 Determine centers of percussion for various failure scenes, and back out natural frequency from there.
- Acceptance of boom tube element cleanliness:
 Sample is ready for cleaning: ultrasonic in acetone, then isopropyl alcohol.
 Deliver to Harry Culver, GSFC.
